Introdução ao OpenGL

Conteúdo

- ⊙ Introdução
- ⊙ Tipos de dados
- ⊙ Nomenclatura de funções
- ⊙ Esqueleto de programa
 - ⊙ Atividades básicas
- ⊙ Esqueleto de programa usando GLUT
 - ⊙ Inicialização
 - ⊙ *Callback* de desenho
- ⊙ Exemplos de aplicações

OpenGL

- ⊙ **Open Graphics Library**
- ⊙ Generic graphics API 2D/3D
 - ⊙ Only contains simple primitives
 - ⊙ Complex models built on these primitives
- ⊙ Independent of the operating system
- ⊙ Independent of the window management system

Pormenor

Efeitos ambiente

“Bits and bytes”

- ⊙ OpenGL
- ⊙ GLU – OpenGL Utility library
- ⊙ GLUT – OpenGL Utility Toolkit
- ⊙ GLX / WGL / CGL – OpenGL for X-
Windows/OpenGL for Windows/OpenGL for Mac
OS X
- ⊙ Java bindings
- ⊙ GLAx – OpenGL ActiveX
- ⊙ CsGL – OpenGL for C#
- ⊙ WebGL – OpenGL for HTML 5

Tipos de dados

Suffix	Data Type	Typical Corresponding C-Language Type	OpenGL Type Definition
b	8-bit integer	signed char	GLbyte
s	16-bit integer	short	GLshort
i	32-bit integer	int or long	GLint, GLsizei
f	32-bit floating-point	float	GLfloat, GLclampf
d	64-bit floating-point	double	GLdouble, GLclampd
ub	8-bit unsigned integer	unsigned char	GLubyte, GLboolean
us	16-bit unsigned integer	unsigned short	GLushort
ui	32-bit unsigned integer	unsigned int or unsigned long	GLuint, GLenum, GLbitfield

Nomenclatura de funções

- ⊙ Function name prefix
 - ⊙ gl → OpenGL
 - ⊙ glu → *OpenGL* Utility Library
 - ⊙ glut → *OpenGL* Utility Toolkit
 - ⊙ glaux → *OpenGL* Auxiliary Library (deprecated)
- ⊙ { gl | glu | glut } FUNC [{ 1 | 2 | 3 | 4 } TYPE [v]]
 - ⊙ TYPE := b | d | f | i | s | ub | ui | us
- ⊙ Examples:
 - ⊙ **glColor3b, glColor3f, glColor4d, glColor4dv**
 - ⊙ **glLoadMatrixd, glLoadMatrixf**
 - ⊙ **gluLookAt**
 - ⊙ **glutSwapBuffers**

Esqueleto de programa

```
#include <whateverYouNeed.h>
int main()
{
    InitializeAWindowPlease();
    glClearColor(0.0, 0.0, 0.0, 0.0);
    glClear(GL_COLOR_BUFFER_BIT);
    glMatrixMode(GL_PROJECTION)
    glLoadIdentity();
    glOrtho(0.0, 1.0, 0.0, 1.0, -1.0, 1.0);
    glColor3f(1.0, 1.0, 1.0);
    glBegin(GL_POLYGON);
        glVertex3f (0.25, 0.25, 0.0);
        glVertex3f (0.75, 0.25, 0.0);
        glVertex3f (0.75, 0.75, 0.0);
        glVertex3f (0.25, 0.75, 0.0);
    glEnd();
    glFlush();
    UpdateTheWindowAndCheckForEvents();
    return 0;
}
```

Clear display

Define the coordinate system

Draw

Sistema de coordenadas

⊙ `gluOrtho2D(0.0, 200.0, 100.0, 200.0)`

left

right

bottom

top

Default
near=1.0
far=-1.0

Cor

- ◎ **RGBA**

- `glColor{3|4}`
red + green + blue [+ alfa]
alfa : *blending* & transparency (talk later)
[0.0 , 1.0]

- ◎ **Index (color map)**

- Uses *color map* from the window system
Not used in SGRAI

- ◎ **Exemplos**

- ```
glColor3f(0.0, 0.0, 0.0); /* black */
glColor3f(1.0, 0.0, 0.0); /* red */
glColor3f(0.0, 1.0, 0.0); /* green */
glColor3f(1.0, 1.0, 0.0); /* yellow */
glColor3f(0.0, 0.0, 1.0); /* blue */
glColor3f(1.0, 0.0, 1.0); /* magenta */
glColor3f(0.0, 1.0, 1.0); /* cyan */
glColor3f(1.0, 1.0, 1.0); /* white */
```

# Desenhar

- ⊙ glBegin(mode) / glEnd()
  - ⊙ Define na object
  - ⊙ example: poligon (GL\_POLYGON)
- ⊙ glVertex...()
  - ⊙ Define a vertex of the object
- ⊙ glFlush()
  - ⊙ Forces the OpenGL pipeline to complete all the drawing processing
